# Module 07: Pickling and structured error handling

---

## Introduction

---

Pickling is another way to work with text files that allows you to save data objects in their original format, without special formatting and precise syntax. If you can anticipate the errors your user might encounter, you can provide human-readable error messages or mitigating code through the use of try/except error handling.

## Pickle

---

Pickle is a common serialization module that converts Python objects to bytestring (binary text file) and back again. You can import the pickle module using `import pickle`.

## Reading data from a binary file

A binary file is a non-secure text file that is only partially human readable, but can store data objects without needing to process them to a specific syntax.

To read content from a binary file use the `pickle.load()` function (Figure 1).

```
objFile = open("AppData.dat", "rb+") # opens file in read+ mode
lstData = pickle.load(objFile) # Loads data and stores to a list
objFile.close() # closes file
```

**Figure 1. Reading data from binary file using pickle module.**

## Writing data to a binary file

The `pickle.dump()` function takes the data from your script and "dumps" it to your file. The entire data object is saved, so you don't have to go through the work of looping through the data set and formatting (Figure 2).

```
objFile = open("AppData.dat", "wb")
pickle.dump(lstData, objFile)
objFile.close()
```

**Figure 2. Writing data to binary file using pickle module.**

More information available in the [Official Python Pickling Documentation](#) (external site).

## Error handling (try-except)

---

This is a way to present the user of your script with a human-readable error code if you anticipate a point where the script could fail (Figure 3).

```
try:
    x / y
except:
    print("Could not divide " + str(x) + " by " + str(y))
```

**Figure 3. Try/except error handling.**

Additionally you can create exceptions specific to certain errors (Figure 4).

```
try:
    x = int(input("Please enter a number: "))
    break
except ValueError:
    print("Oops! That was no valid number. Try again...")
```

**Figure 4. Try/except with a named exception.**

## Assignment07 script

---

To complete this assignment I created a script that loads an ID and Name from a binary file,  
and gives you the option to overwrite the content of the file with a new ID and Name.

I started by creating a set of processing functions `save_data_to_file()` and `read_data_from_file()` that use the pickle module's dump and load functions respectively.

From there I created functions in my presentation block that allow me to print a menu, collect a menu choice, or collect user data.

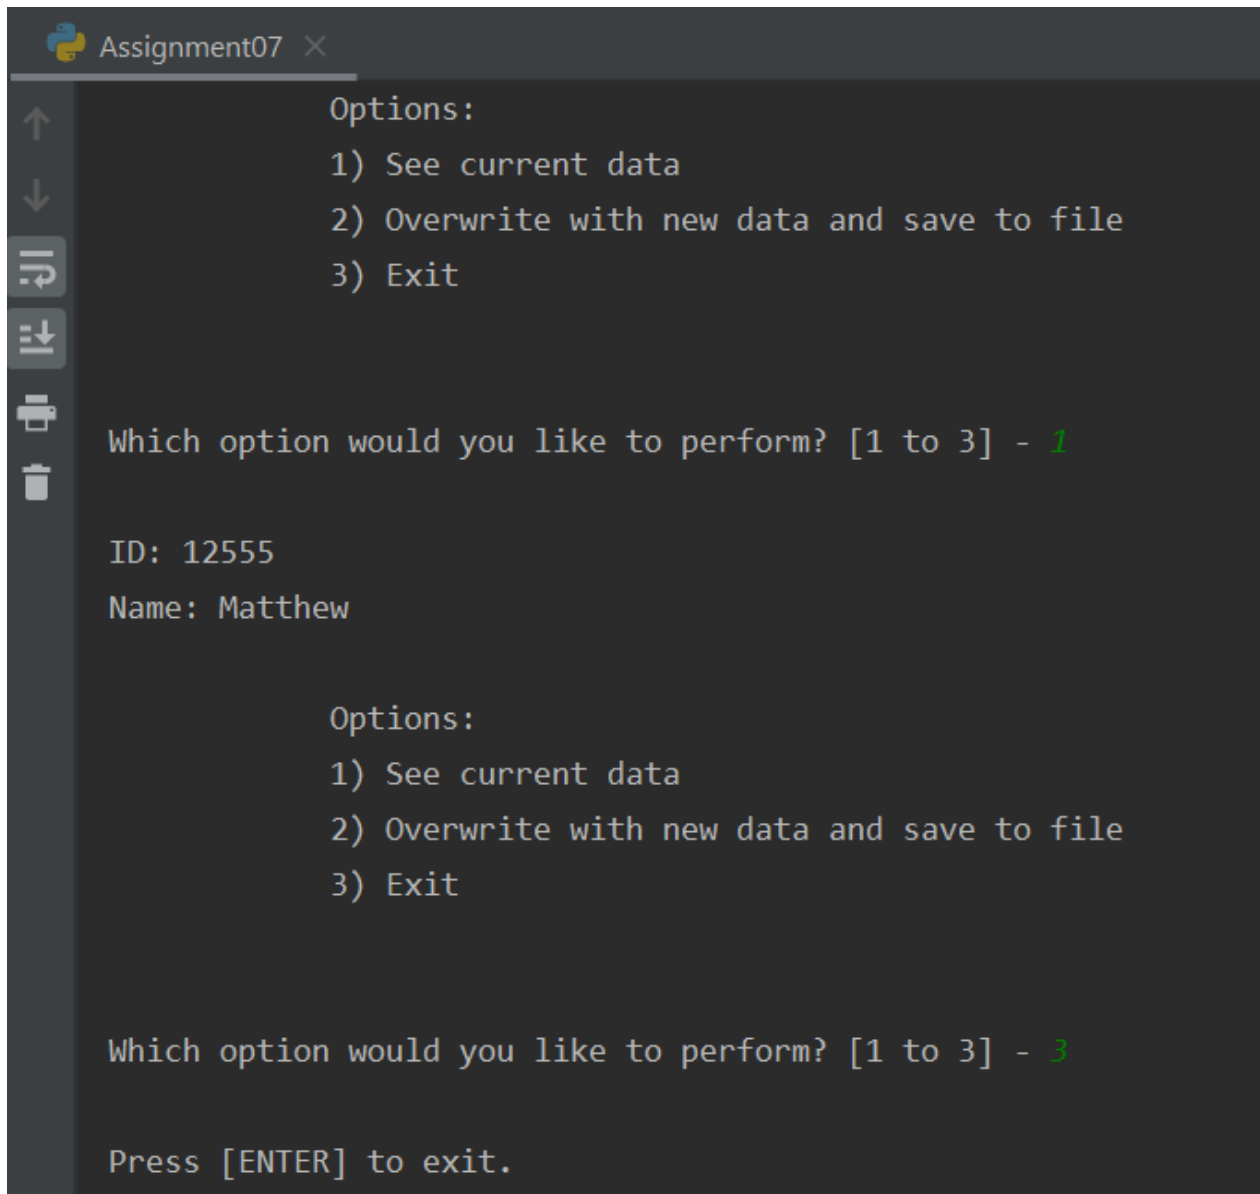

In the main body of my script I started by loading data from file. If the file doesn't exist or doesn't contain data, an error is thrown. To prevent this I used try/except error handling to give a human-readable message if the file isn't present (Figure 5).

```
try:
    lstCustomer = read_data_from_file(strFileName)
except:
    print("No existing data in file \"AppData.dat\"")
```

***Figure 5. Error handling.***

Then I use a `while(True)` loop to present the menu of options to the user until option 3 is selected. If options 1 or 2 are entered, the if/elif statements contain the appropriate IO and processing functions to complete the task selected.

The script runs in PyCharm (Figure 6).

```
Assignment07 ×
Options:
1) See current data
2) Overwrite with new data and save to file
3) Exit

Which option would you like to perform? [1 to 3] - 1

ID: 12555
Name: Matthew

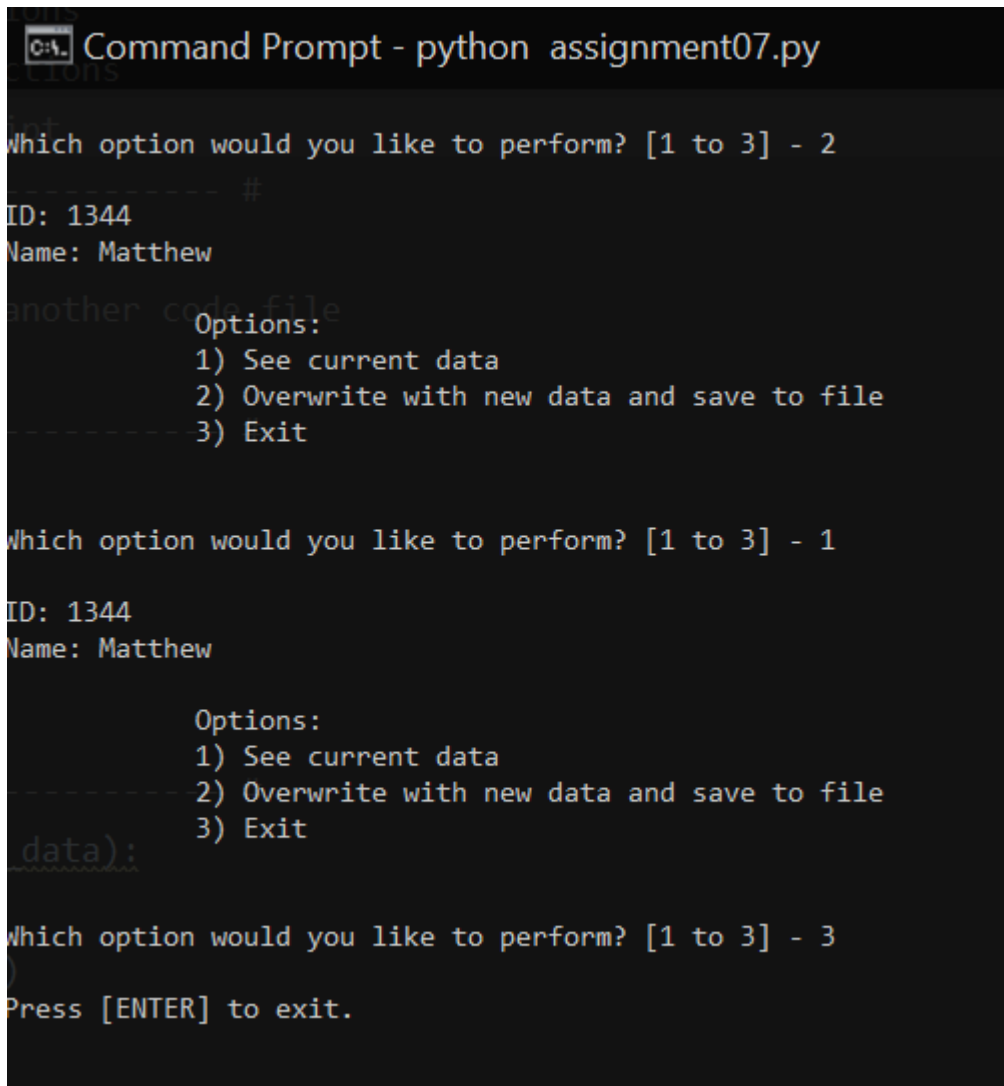

Options:
1) See current data
2) Overwrite with new data and save to file
3) Exit

Which option would you like to perform? [1 to 3] - 3

Press [ENTER] to exit.
```

**Figure 6. Script running in PyCharm.**

The script runs in the Windows command prompt (Figure 7).

```
C:\> python assignment07.py

Which option would you like to perform? [1 to 3] - 2
----- #
ID: 1344
Name: Matthew

Options:
1) See current data
2) Overwrite with new data and save to file
3) Exit

Which option would you like to perform? [1 to 3] - 1

ID: 1344
Name: Matthew

Options:
1) See current data
2) Overwrite with new data and save to file
3) Exit

Which option would you like to perform? [1 to 3] - 3

Press [ENTER] to exit.
```

**Figure 7.** Script running in Windows command prompt.

## Summary

---

Using the pickle module and structured error handling I was able to import code that makes it easier to save/write a data object to file, and ensure any expected errors are mitigated.
